cm006

Isabel

9/19/2019

Optional, but recommended startup:

- 1. Change the file output to both html and md documents (not notebook).
- 2. knit the document.
- 3. Stage and commit the rmd, and knitted documents.

Intro to dplyr syntax

Load the gapminder and tidyverse packages. Hint: suppressPackageStartupMessages()! - This loads dplyr, too.

```
# load your packages here:
library(gapminder)
library(tidyverse)
```

select() (8 min)

1. Make a data frame containing the columns year, lifeExp, country from the gapminder data, in that order.

```
select(gapminder, year, lifeExp, country)
```

```
## # A tibble: 1,704 x 3
##
      year lifeExp country
##
             <dbl> <fct>
     <int>
##
   1 1952
              28.8 Afghanistan
  2 1957
##
              30.3 Afghanistan
## 3 1962
              32.0 Afghanistan
## 4 1967
              34.0 Afghanistan
## 5 1972
              36.1 Afghanistan
## 6 1977
              38.4 Afghanistan
##
  7 1982
              39.9 Afghanistan
##
  8 1987
              40.8 Afghanistan
## 9 1992
              41.7 Afghanistan
## 10 1997
              41.8 Afghanistan
## # ... with 1,694 more rows
```

2. Select all variables, from country to lifeExp.

```
# This will work:
select(gapminder, country, continent, year, lifeExp)
```

```
## # A tibble: 1,704 x 4
##
      country
                  continent year lifeExp
      <fct>
##
                  <fct>
                            <int>
                                    <dbl>

```

Piping, %>% (8 min)

Note: think of %>% as the word "then"!

Demonstration:

Here I want to combine select() Task 1 with arrange() Task 3.

This is how I could do it by *nesting* the two function calls:

```
# Nesting function calls can be hard to read
arrange(select(gapminder, year, lifeExp, country), year, lifeExp) #selecting the columns first, and the
```

Now using with pipes:

```
# alter the below to include 2 "pipes"
gapminder %>%
 select(year, lifeExp, country)%>%
 arrange(year, lifeExp)
## # A tibble: 1,704 x 3
##
      year lifeExp country
##

Notice the backwards compatibility! No need for loops!

Try the same thing, but with transmute (drops all other variables).

```
gapminder %>%
transmute(gdpBill = gdpPercap*pop/100000000)
```

```
## # A tibble: 1,704 x 1

```

The if_else function is useful for changing certain elements in a data frame.

Example: Suppose Canada's 1952 life expectancy was mistakenly entered as 68.8 in the data frame, but is actually 70. Fix it using if_else and mutate.

```
gapminder %>%
  mutate(lifeExp= ifelse(country=="Canada" & year==1952, 70, lifeExp))%>%
  filter(country=="Canada")
```

```
## # A tibble: 12 x 6

These functions we've seen are called **vectorized functions**.

git stuff (Optional)

Knit, commit, push!

Bonus Exercises

If there's time remaining, we'll practice with these three exercises. I'll give you 1 minute for each, then we'll go over the answer.

- 1. Take all countries in Europe that have a GDP per capita greater than 10000, and select all variables except gdpPercap. (Hint: use -).
- 2. Take the first three columns, and extract the names.
- 3. Of the iris data frame, take all columns that start with the word "Petal".
 - Hint: take a look at the "Select helpers" documentation by running the following code: ?tidyselect::select_helpers.
- 4. Convert the population to a number in billions.
- 5. Filter the rows of the iris dataset for Sepal.Length >= 4.6 and Petal.Width >= 0.5.

Exercises 3. and 5. are from r-exercises.
